

(#57162DY) DYSON BELT LIFTER TOOL INSTRUCTIONS

1. Set Main Tool metal frame over the nozzle as pictured, arms facing in to center of nozzle.
2. Take “T-Shaped” Hook Tool and put it under the belt (works easier if you do it from the brush-side of the pulley) with the hook facing toward the pulley-side (outside edge) of the nozzle.
3. Pull up on the belt and rest hook against either of the round pegs facing center of nozzle. Using one peg as the fulcrum, move belt up and hook to the other peg. Then repeat on the other side until the belt is over the two pegs as pictured.
4. You can now remove the brush from the nozzle and replace it. *(Please note, this may be a little tricky at first but will become easier each subsequent time.)*
